STUDYMATE

Student Productivity & Study Planner Website

PROJECT TYPE	TECHNOLOGIES	DATA STORAGE
Frontend web application	HTML · CSS · JavaScript	Browser localStorage

1. Project Overview

StudyMate is a simple, mobile-responsive website that helps students plan study tasks and monitor daily progress. It follows a beginner-friendly HTML, CSS, and JavaScript approach, while adding useful interactive features and a practical student-focused purpose.

2. Problem Statement

Students may forget deadlines or struggle to organize assignments, revision, and personal study goals. StudyMate brings these activities into one clear dashboard so users can manage their workload and see what is completed.

3. Main Features

Task management	Add tasks with a title, subject, due date, and priority; edit or delete them.
Completion tracking	Mark tasks complete and view remaining and completed work.
Dashboard summary	Show total tasks, pending tasks, completed tasks, and overall progress.
Subject organization	Group tasks by subjects such as Programming, Mathematics, or English.
Search and filters	Filter tasks by status, subject, or priority and quickly find a task.
Responsive layout	Use the site comfortably on desktop, tablet, and mobile screens.
Persistent data	Use localStorage to retain tasks after refreshing or reopening the browser.

4. Pages / Sections

- **Home / Dashboard:** welcome message, progress cards, and upcoming tasks.
- **My Tasks:** task form, task list, edit/delete actions, and status controls.
- **Progress:** simple completion percentage and subject-wise task counts.
- **About:** short explanation of the project and how to use it.

5. Technology Stack

HTML5: page structure and forms. **CSS3:** layout, colors, responsive design, and visual styling. **JavaScript:** adding, editing, filtering, and completing tasks. **localStorage:** saving task data in the browser. No server or database is required for this prototype.

6. How It Works

1. Open the website and view the dashboard.

2. Enter a task, select a subject, due date, and priority, then save it.

3. Use filters to find tasks and mark them complete when finished.

4. The dashboard updates automatically and the data is saved in localStorage.

7. Expected Outcome

A clean, working student planner that demonstrates core frontend development skills: semantic HTML, responsive CSS, DOM manipulation, event handling, form validation, filtering, and browser-based data persistence.

350-Character Project Description

StudyMate is a responsive student productivity website built with HTML, CSS, and JavaScript. Students can add study tasks, set deadlines, mark work complete, and track progress through a simple dashboard. It includes priority labels, subject-wise organization, and localStorage, so tasks remain saved after refreshing without a backend. for students.

Character count: 350 (including spaces and punctuation).
